Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention provides membrane-bound PRO polypeptides and polynucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including LDL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadhesins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          0; Gaps

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematicus, rheumatoria arthritis, selected from systemic lupus erythematicsus, rheumatoria arthritis, systemic selected from systemic chronic arthritis, spondyloarthropathies, systemic selected in vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune thrombocytopeenia, thyroiditis, diabetes mellitus, immune-mediated renal disease, demyelinating diseases, inflammatory bowel peripheral nervous systems, hepatobiliary diseases, inflammatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, alloanmatory bowel disease, gluten-sensitive enteropathy and Whipple's disease, allounding cor immune-mediated skin diseases, allergic disease, immunological diseases, fire rejection and graft-versus-host-disease. AACS6397 to AACS6598 cor represent PCR primers and hybridisation probes used in the isolation of human PRO polymucleotide and protein sequences given in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PGEHAKDEYVLYYYSNLSVPIGREQNRVHLMGDILCNDGSLLLQDVQEADQGTY1CEIRL 120
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eleven novel inflammation-associated genes have been identified in cDNA their coexpression with the Known inflammon selected according to their coexpression with the Known inflammon genes, CDIG, L-selectin, Src-like adapter protein, IP-30, superoxidase homoenzyme subunits, alpha-lantitypsin, Clq-A, S-lipoxygenses activating protein and SRC family tyrosine kinase. The novel polymucleotides may be used in hybridization assays to diagnose a disease or condition associated with altered useful in compositions for the diagnosis and treatment of such diseases associated with inflammation including rheumatoid arthritis, Crohn's diseases, multiple sclerosis, AIDS, diabetes mellitus, asthma and allergy. Additionally the polymucleotides of the invention may be used for gene therapy. The present sequence is human inflammation associated protein

For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO polypeptide and protein sequences used in the exemplification of the

                     ANU12172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to mediate biological activities of cells expressing PRO polypeptides, to mediate biological activities of cells expressing PRO polypeptides expression in a coll sample to that in a control sample. Some necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or pericyte cells, the release of proteoglycans from carrilage, the proliferation or pericyte cells, the release of proteoglycans from expression in proliferation of conficeration of inner ear utricular supporting cells or of representation of inner ear utricular supporting cells or of reproliferation of inner ear utricular supporting cells or of repropried may modulate glucose or free faity acid uptake by skeletal (PMD) peptides may modulate glucose or free faity acid uptake by skeletal viroliseration of proliferation of endothelial cells or of repropried or by adhoryces, inhibit binding of A-peptide to factor convoluted in binding interactions. The POLYMOLGECIES modeling PRO colypeptides can be used in assays to identify molecules colls or knock out animals and can be used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PGEHAKDEYVLYYYSNLSVPIGRFQNRVHLMGDILCNDGSLLLQDYQEADQGTXICEIRL 120

```
The invention relates to human nucleic acids (AAIS7798-AAI61369) and the encoded polypeptides (AAM88642-AAM42213) with nootropic, encoded polypeptides (AAM88642-AAM42213) with nootropic, in gene therapy. A composition containing a polypeptide or polynucleotide in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous coff system, such as peripheral nervous injuries, peripheral nervous system, such as peripheral nervous system diseases, such as and calised neuropathy and central nervous system diseases, such as a lateral sclerosis, and Shy-brager Syndrome. Other uses include the cutilisation of the activity, chembracic/chemokinetic activity, haemostatic/chemokinetic activity, haemostatic/chemokinetic activity, haemostatic/chemokinetic activity, haemostatic/chemokinetic activity, haemostatic/chemokinetic activity, haemostatic/chemokinetic activity, arthritis and inflammation, leukaemias and corns assays for receptor activity, arthritis and inflammation, leukaemias and corns activity arthritis and inflammation, leukaemias and corns are activity activity and inflammation, leukaemias and corns activity arthritis and inflammation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
Novel nucleic acids and polypeptides, useful for treating disorders such as central nervous system injuries.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9

PRO polynucleotides used to produce polypeptides used to target bioactive

N-PSDB; AAF44256

```
The present invention describes human secreted and transmembrane PRO
proteins. The PRO proteins have cytostatic activity. The PRO proteins can
proteins. The PRO proteins have cytostatic activity. The PRO proteins can
cadiolables or antibodies, that cause cell death. PRO nucleotide
cadionables or antibodies, that cause cell death. PRO nucleotide
cancer, and their fragments, can be used as hybridisation probes, in
chromosomal and gene mapping, and in the generation of anti-sense RNA and
chromosomal and screen therapeutically useful reagents. The PRO nucleotide
concer. Anti-PRO antibodies can be used in diagnostic assays. ARF4420 to
cancer. Anti-PRO antibodies can be used in diagnostic assays. ARF4420 to
cancer. Anti-PRO sequences. ARF44087 to AAF44269 and AAB65134 to
isolation of human PRO sequences. ARF44087 to AAF44269 and AAB65154 to
the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                  ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    180

Goddard A, Godowski PJ; phan JF, Watanabe CK, Wood WI; Gerritsen ME, Goddard Smith V, Stephan JF, Baker KP, Desnoyers L, Grimaldi JC, Gurney AL,

WPI; 2002-172001/22. N-PSDB; ABK33633. One hundred and twenty two nucleic acids encoding PRO polypeptides, useful for treating a PRO related disorder and for diagnosing tumors such as lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor or liver tumor.

Claim 11; Fig 196; 359pp; English.

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides cencode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, especially lung cancer, colon cancer, breast tumour, prostate tumour, rectal tumour inversession of liver tumour. The PRO polypeptides are useful for stimulating the proliferation of or gene expression, in pericyte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, for stimulating the proliferation of normal human blood, for stimulating or inhibiting the proliferation of normal human dermal weight markers and for tissue typing. The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, protein sequences of the invention.

Sequence 394 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, antiangiogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88267 represent primers and probes used in the

                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                     The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atheroscierosis, hypertension, arterial restenosis, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The present sequence is a PRO protein of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             KGESQVFKKAVVLHVLPEEPKELMVHVGGLIQMGCVFQSTEVKHVTKVEWIFSGRRAKEE 180

PRO1375, which stimulate proliferation of stimulated T-lymphocytes therapeutically useful for enhancing immune response and in cancer treatments.

Claim 12; Fig 304; 648pp; English

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in linking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO156, and PRO136, PRO43, PRO826, PRO166 or PRO535, PRO826, PRO816, PRO1360 and PRO1387 induce c-fos in endothelial growth, and are thus useful for treating canditions or disorders where angiogenesis would be eneficial, e-g. wound healing and antagonist of this polypeptide are useful for treating cancerous tumours. PRO812 inhibits vascular colled are useful for treating cancerous tumours. PRO812 inhibits vascular endothelial growth factor (VEGF) stimulated proliferation of endothelial growth factor (VEGF) stimulated proliferation of mammals which would be beneficial in inhibiting tumour growth. PRO826, PRO1046, PRO1144, PRO1346 and PRO1375 stimulated proliferation of stimulated T-lymphocytes and are therapeutically useful for renhancing immune response. PRO828, PRO826, PRO1068 or PRO10132 enhance survival of cretinal neurons cells (PRO1132 is also enhances survival/proliferation of disorders of injuries, e-g. retuinities pigmentosum, AMD. PRO819, PRO813 and therefore are useful for treating togenesses or other ephropathies associated with dermatitis, herpetiformis or Crohn's classase PRO1130, PRO814, PRO1132, PRO1192 and PRO116eration and/or redifferentiation of chondrocytes in culture and are thus useful for treating sports injuries, and arthritis. This is the amino acid sequence of a novel human PRO protein

The invention describes an isolated nucleic acid (1) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 275 nucleotide sequences, and which encodes a corresponding polypeptide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (1) is used to detect the Optypeptide. Modulate a biological activity of a cell expressing a CR polypeptide, modulate a biological activity of a cell, stimulate the telease of tumour necrosis factor (TNP)-alpha from human blood, modulate the proliferation or differentiation of cells or gene expression, the uptake of glucose or free fatty acid by cells, stimulate or inhibit the proliferation or differentiation of cells or gene expression, stimulate the release of proteoglycans, stimulate the release of cytokine confident or differentiation of cells or gene expression.

Stimulate the release of proteoglycans, stimulate the release of cytokine confident or differentiation of cells or gene expression, confident or differentiation of cells or gene expression, confidentiation of acid and polypeptide encoded by it, are useful for treating inflammatory diseases, organ failure, atherosclerosis, cardiac injury, infertility, concert, or diaberic complications. The nucleic acid is useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. Both are useful in tissue typing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   61 PGEHAKDEYVLYYYSNLSVPIGRFQNRVHLMGDILCNDGSLLLQDVQBADQGTYICEIRL 120

New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes.

Claim 12; Fig 304; 650pp; English.

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that specifically bind to the PRO polypeptide for linking a bioactive molecule to a cell expressing a PRO protein and for modulating at least molecule to a cell expressing a PRO protein and for modulating at least contained and properties or activity of a cell. The PRO pypeptides or polynucleotides are also useful in gene therapy, in chromosome dentification, as chromosome markers, or in generating probes. The PRO polymetides are useful as molecular markers for protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO outibodies and nucleic acids may also be used in issue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from recombinant cell culture or natural sources. The sequences presented in ABUGO478-ABUG0624 are the PRO polymucleotides of the invention. Note: The sequence data for this patent

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       (GETH)
                                                                                                                                                                                                                                                                                                                                                                                                                         8-AUG-
```

The invention provides membrane-bound PRO polypeptides and polymucleotides encoding them. The PRO sequences of the invention were identified based on extracellular domain homology screening. The PRO sequences have homology with proteins including ibL receptors, TIE ligands and various enzymes. The membrane-bound proteins and receptor molecules are useful as pharmaceutical and diagnostic agents. Receptor immunoadheeins, for instance, can be used as therapeutic agents to block receptor-ligand interactions. The membrane-bound proteins can also be employed for screening of potential peptide or small molecule inhibitors of the relevant receptor/ligand interaction. The PRO encoding sequences are useful as hybridization probes, in chromosome and gene mapping and in the generation of antisense RNA and DNA. PRO nucleic acid sequences will also be useful for the preparation of PRO polypeptides, especially by recombinant techniques

The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCS) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA7721 and AAB2438 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the

AAS21244-AAS21518 encode for novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO C polypeptides, to link bioactive molecules to cells expressing PRO C polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO C polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour cof ferentiation of chondrocytes, the proliferation or gene expression in dericty cells, the release of proteoglycans from cartilage, the proliferation of pericyte cells, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells. Some of the PRO polypeptides may modulate glucose or free fatty acid uptake by skeletal colypeptides may modulate glucose or free fatty acid uptake by skeletal cursole cells or by adipocytes; or inhibit binding of A-peptide to factor involved in binding interactions. The polymucleotides encoding PRO polypeptides can be used to generate probes, antisense RNA/DNA, corresponding cor knock out animals and can be used in gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö

proteins. The PRO proteins have cytostatic activity. The PRO proteins can be used for targeted delivery of bloative molecules, such as toxins, radiolabels or antibodies, that cause cell death. PRO nucleotide chromosomal and gene mapping, and in the generation of anti-sense RNA and DNA. They may also be used to produce transgenic animals which are used and protein sequence can be used for tissue typing and in treating and in treating and in treating and in treating and protein sequence can be used for tissue typing and in treating cancer. Anti-PRO antibodies can be used in diagnostic assays. AAF44270 to 1solation of human PRO sequences and hybridisation probes used in the AAB65300 represent human PRO polynucleotide and protein sequences as MAR44300 to EAR685300 represent human PRO polynucleotide and protein sequences given in the exemplification of the present invention present invention describes human secreted and transmembrane PRO seins. The PRO proteins have cytostatic activity. The PRO protein

• hundred and twenty two nucleic acids encoding PRO polypeptides, ful for treating a PRO related disorder and for diagnosing tumors such lung cancer, colon cancer, breast tumor, prostate tumor, rectal tumor liver tumor. Godowski PJ; مع Wood WI; Watanabe CK, Goddard A, Gerritsen ME, Goddard Smith V, Stephan JF, L, AL, Desnoyers C, Gurney WPI; 2002-172001/22. P-PSDB; AAU83689. Grimaldi JC,

Claim 2; Fig 195; 359pp; English.

The invention relates to one hundred and twenty two nucleic acids encoding PRO polypeptides. The sequences of the 122 PRO polynucleotides encode human secreted proteins. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating a PRO related disorder. The PRO polypeptides are useful for diagnosing tumours, percent disorder. The PRO polypeptides are useful for diagnosing tumours, rectal tumour or liver tumour. The PRO polypeptides are useful for stimulating the proliferation of, or gene expression, in periorte cells, for stimulating the release of tumour necrosis factor-alpha from human blood, constituing the release of tumour necrosis factor-alpha from human blood, constituing the proliferation of normal human blood, consideration of ninhibiting the proliferation of normal human blood, considerations and for tissue typing, The PRO nucleic acids have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping, ABK313657 represent human PRO protein coding sequences of the invention

ABL88072 to ABL88258 encode the PRO proteins given in ABB84817 to ABB85003. The PRO proteins and polynucleotides have cardiant, cytostatic, antianglogenic, hypotensive, vulnerary and antiarteriosclerotic activities, and can be used in gene therapy. The PRO polynucleotides, proteins, agonists and antagonists are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder in a mammal, e.g. atherosclerosis, hypertension, arterial restenosis, rheumatoid arthritis, angiogenesis (such as breast carcinoma and liver carcinoma) and wound healing. The PRO polynucleotides have applications in molecular biology, including use as hybridisation probes, and in chromosome and gene mapping. ABL88259 to ABL88257 represent primers and probes used in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Paoni NF;

The present invention provides the protein and coding sequences of human PRO proteins. These are useful for treating or diagnosing a cardiovascular, endothelial or angiogenic disorder, including cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenois, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis, lymphangitis, tumour angiogenesis (such as breast carcinoma and liver carcinoma) and wound One hundred and eighty seven nucleic acids encoding PRO polypeptides, useful in diagnosis and treatment of cardiovascular (e.g. myocardial infarction), endothelial or angiogenic disorders in a mammal. Paoni NF coding sequence of the invention Gerber H, Gerritsen ME, Goddard A, J, Hillan KJ, Marsters SA, Pan J, TK, Williams PM, Wood WI, Ye W, The present sequence is a Claim 1; Fig 233; 567pp; English. Watanabe CK, AL,

il isolated PRO polypeptides e.g., PRO826, PRO1068, PRO1184, PRO1346 PRO1375, which stimulate proliferation of stimulated T-lymphocytes therapeutically useful for enhancing immune response and in cancer treatments Novel and are

Claim 2; Fig 305; 648pp; English

The invention describes an isolated human PRO polypeptide. The PRO polypeptides are useful in detecting PRO polypeptides in a sample, in polypeptides are useful in detecting PRO polypeptides in a sample, in inking a bioactive molecule to a cell expressing a PRO polypeptide, and in modulating at least one biological activity of a cell expressing a PRO polypeptide. PRO1312 stimulates hypertrophy of neonatal heart and is thus useful for treating cardiac insufficiency disorders. PRO1584 and PRO1186 stimulate adrenal cortical capillary endothelial growth, and PRO136, PRO943, PRO943, PRO926, PRO1068 or PRO535, PRO926, PRO919, PRO1367, PRO1367 induce c-fos in endothelial cells, and are thus useful for treating conditions or disorders where angiogenesis would be beneficial, e.g. wound healing and antagonist of this polypeptide are useful for treating cancerous tumours. PRO912 inhibits vascular condothelial growth factor (VEGP) stimulated proliferation of endothelial cells and is thus useful for inhibiting endothelial cell growth, in mammals which would be beneficial in inhibiting rumour growth.

PRO828, PRO826, PRO1068 or PRO132 enhance survival of retinal neurons cells (PRO132 is also enhances survival/proliferation crod photoreceptor cells) and therefore are useful for treating retinal disorders of injuries, e.g. retinitis pigmentosum, AMD. PRO819, PRO813 and PRO11066 induce proliferation of mammalian kidney mesangial cells, and therefore are useful for treating kidney disorders associated with decreased mesangial cell function such as Berger disease or other nephropathies associated with dermatitis, herpetiformis or Crohn's disease. PRO110, PRO844, PRO1112, PRO1192 and PRO1387 induce the proliferation and/or redifferentiation of chondrocytes in culture and ar thus useful for treating sports injuries, and arthritis. The invention describes an isolated mucleic acid (1) comprising, or which has 80 % sequence identity to, or the full-length coding sequence of, one of 275 mucleotide sequences, and which encodes a corresponding code of 275 mucleotide sequences, and which encodes a corresponding polypeptide selected from 275 amino acid sequences, where all sequences are given in the specification. The polypeptide encoded by (1) is used to detect PRO polypeptide, modulate a biological activity of a cell, stimulate the PRO polypeptide, modulate a biological activity of a cell, stimulate the release of tumour necrosis factor (TNF)-alpha from human blood, modulate the proliferation or differentiation of cells or gene expression, the proliferation or differentiation of cells or gene expression, confirm paripheral blood enconuclear cells, inhibit the binding of A-peptide from paripheral blood enconuclear cells, inhibit the binding of A-peptide of acid and polypeptide encoded by it, are useful for treating inflammatory diseases, organ failure, atherence of tumour in a mammal. The nucleic cofficences, premature aging, acquired immunodeficiency syndrome (AIDS), cancer, or diabetic complications. The nucleic acid is useful as hybridisation probes, in chromosome and gene mapping, and in generating antisense RNA or DNA. The polypeptides are useful in tissue apping. This sequence encodes a novel human secreted and transmembrane PRO ô New secreted and transmembrane PRO nucleic acids, for treating inflammation, organ failure, atherosclerosis, cardiac injury, infertility, birth defects, premature aging, axquired immunodeficiency Gao W; CGGCTCGAGTGCAGCTGTGGGAGATTTCAGTGCATTGCCTCCCCTGGGTGCTCTTCATC Gaps Deforge L, Desnoyers L, Filvaroff E, G. (GETH) GENENTECH INC.

Godowski PJ; Paoni NF; Wood WI; Eaton Ashkenazi AJ, Baker KP, Botstein D, Desnoyers L, Eaton Ferrara N, Fong S, Gerber H, Gerritsen ME, Goddard A, Grimaldi JC, Gurney AL, Kljavin IJ, Napier MA, Pan J, Roy MA, Stewart TA, Tumas D, Watanabe CK, Williams PM, MA, Zhang

2003-288106/28 P-PSDB; ABU60611. New transmembrane polypeptides and nucleic acids encoding the polypeptides, useful in gene therapy, in chromosome identification, chromosome markers, or in generating probes.

Claim 2; Fig 303; 650pp; English

The invention discloses isolated PRO secreted/transmembrane polypeptides comprising a sequence without signal peptide and the nucleic acid encoding them. The polypeptides can be used to raise antibodies that

780

721

molecule to a cell expressing a PRO protein and for modulating at least one biological activity of a cell. The PRO polypeptides or polymocleotides are also useful in gene therapy, in chromosome identification, as chromosome markers, or in generating probes. The PRO polypeptides are useful as molecular markers for protein electrophoresis, and the isolated nucleic acids may be used for recombinantly expressing those markers. The PRO polypeptides and nucleic acids may also be used in tissue typing. Anti-PRO antibodies are useful in diagnostic assays for PRO, and in affinity purification of PRO from recombinant cell culture or matural sources. The sequences presented in ABX90083-ABX90468 are the genes encoding, the primers amplifying and the probes detecting the PRO polymucleotides of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at ó 240 240 120 120 180 180 300 300 360 360 420 420 480 480 540 540 600 600 960 720 9 9 TIGGATITIGAAAGITIGAGAGCAGCATGITITIGCCCACTGAAACTCATCCTGCTGCCAGTG CATGTGGGTGATTCAGCTCTGATGGGTGTTTTCCAGAGCACAGAGACAATGTATA TTCAAGATAGACTGGACTCTGTCACCAGGAGGAGGACGCCAAGGACGAATATGTGCTATAC 1 CGGCTCGAGTGCAGCTGTGGGGAGATTTCAGTGCATTGCCTCCCCTGGGTGCTCTTCATC CGGCTCGAGTGCAGCTGTGGGGAGATTTCAGTGCATTGCCTCCCCTGGGTGCTCTTCATC 61 TrgGartrrGaaaGrrGaaGcarGrrTrrGCCCACrGaaaCrCcarccrGcrGCCAGrG TTACTGGATTATTCCTTGGGCCTGAATGACTTGAATGTTTCCCCGCCTGAGCTAACAGTC TTACTGGATTATTCCTTGGGCCTGAATGACTTGAATGTTTCCCCGCCTGAGCTAACAGTC CATGTGGGTGATTCAGCTCTGATGGGATGTGTTTTCCAGAGGCACAGAAGACAAATGTATA TATTACTCCAATCTCAGTGTGCCTATTGGGCGCTTCCAGAACCGCGTACACTTGATGGGG GACATCTTATGCAATGATGGCTCTCTCTCTCTCCAAGATGTGCAAGAGGCTGACCAGGG ACCTATATCTGTGAAATCCGCCTCAAAGGGGAGAGCCAGGTGTTCAAGAAGGCGGTGTA TTCCGCAATGACGGTTCCATCATGCTTCAAGGAGTGAGGGGGGTCAGATGGAGGGAAACTAC GACATCTTATGCAATGATGGCTCTCTCCTGCTCCAAGATGTGCAAGAGGCTGACCAGGGA ACCTATATCTGTGAAATCCGCCTCAAAGGGGGAGGCCAGGTGTTCAAGAAGGCGGTGGTA crecardrecorrecadadececadadececenterecorrecades createres TCAGGACGCCGCAAAGGAGGAGTTGTATTCGTTACTACCACAAACTCAGGATGTCT GTGGAGTACTCCCCAGAGCTGGGGCCACTTCCAGAATCGTGTGAACCTGGTGGGGGCACATT ATGGGATGTGTTTTCCAGAGCACAGAAGTGAAACACGTGACCAAGGTAGAATGGATATTT ATGGGATGTGTTTTCCAGAGCACAGAAGTGAAACACGTGACCAAGGTAGAATGGATATTT TCAGGACGCCGCCAAAGGAGGAGATTGTATTTCGTTACTACCACAAACTCAGGATGTCT GTGGAGTACTCCCAGAGCTGGGGCCACTTCCAGAATCGTGTGAACCTGGTGGGGGGACATT TTCCGCAATGACGGTTCCATCATGCTTCAAGGAGTGAGGGAGTCAGATGGAGGAAACTAC for linking a bicactive .. The present invention relates to the isolation of novel human PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides and polymucleotides are useful for preparing a medicament useful in the diagnosis and treatment of tumours. Anti-PRO antibodies are useful in diagnostic assays for PRO, by detecting its expression in specific cells, tissues or serum, and for affinity purification of PRO from recombinant cell culture or natural sources. Ack66841-ACA66962 represent cDNA sequences encoding the human PRO polypeptides of the invention. Note: The sequence data for this patent was obtained in sequence content of the sequence data for this patent was obtained in sequence uspective.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TICAAGAIAGACIGGACICIGICACCAGGAGCACGCCAAGGACGAAIAIGIGCIAIAC 300

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes an isolated nucleic acid molecule comprising a sequence with at least 80% identity to: (a) a nucleotide encoding any of 122 PRO (secreted and transmembrane) polypeptides whose sequences are fully defined in the specification; or (b) any of 122 nucleotide sequences having e.g. 4834, 2504 or 1759 bp fully defined in the specification; or the full length coding sequence of any these 122 nucleotide sequences. The PRO polypeptides or polynucleotides are useful as pharmaceuticals, diagnostics, biosensors or bioreactors. These are particularly useful for detecting tumours (e.g. lung tumour, colon tumour, breast tumour, prostate tumour, rectal tumour, or liver tumour) in a mammal, for stimulating the release of TNF-alpha from human blood, for stimulating the proliferation or differentiation of chondrocyte
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New genes, and its encoded secreted and transmembrane polypeptides, useful for stimulating Tumor Necrosis Factor alpha, or chondrocyte or pericyte proliferation, especially for treating lung tumors, arthritis

cells, for stimulating proliferation of pericyte cells, or for modulating normal human dermal fibroblast proliferation. The PRO nucleic acid or polypeptide is also useful for treating tumours or various bone and/or cartilage disorders (e.g. sports injuries or arthritis), or wounds. The PRO polypeptides are useful in drug screening, particularly as targets for therapeutic intervention in these diseases, and in the diagnostic determination of the presence of these diseases, and in the diagnostic also useful as molecular weight markers, or for chromosome identification. The PRO genes are useful as hybridisation probes, or for screening libraries of human cDNA, genomic DNA or mRNA. The PRO genes may also be used in gene therapy, particularly for replacing a defective gene. This sequence encodes a novel human secreted and transmembrane PRO
                                                                                                                                                                                                                                                                                                                                                                                          polypeptide

Novel secreted and transmembrane polypeptide for modulating biological activity of cell expressing the polypeptide, identifying agonists or antagonists of polypeptide, and as molecular weight markers.

Claim 2; Fig 303; 649pp; English.

The present invention relates to the isolation of novel human PRO polypeptides, and the polynucleotide sequences encoding them. The PRO polypeptides are secreted and transmembrane proteins. The PRO polypeptides are useful for detecting other PRO polypeptides, for including the bioactive molecules to calls expressing PRO polypeptides, for modulating biological activities of calls expressing PRO polypeptides, and for for identifying agonists or antagonists. The polymucleotide sequences cancing PRO polypeptides are useful as hybridisation probes, in chromosome and gene mapping, in the generation of antisense RNA and DNA, in the preparation of PRO polypeptides, for generating transgenic animals or knockout animals, to construct hybridisation probes for mapping the gene which encodes the PRO polypeptide, and for the genetic analysis of individuals with genetic disorders, in gene therapy, for chromosome condentification, as chromosome markers, and for sequence encodes a human PRO polypeptide of the invention. Note: The sequence catta for this patent was obtained in electronic format directly for the norms of the invention in the present the norms. from the USPIO web site at seqdata.uspto.gov/psipsDIDEntry.html

/		, ,

. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
